

Codebook- Team Far Behind IIT Delhi, India

Ayush Ranjan, Naman Jain, Manish Tanwar

2. Data Structures :

2.1 - Fenwick, 2.2 - 2D-BIT, 2.3 - Segment Tree, 2.4 - Persistent Segment Tree, 2.5 - DP Optimization

3. Flows and Matching :

3.1 - General Matching, 3.2 - Global Mincut, 3.3 - Hopcroft Matching, 3.4 - Dinic, 3.5 - Ford Fulkerson, 3.6 - MCMF, 3.7 - MinCost Matching

4. Geometry :

4.1 - Geometry, 4.2 - Convex Hull, 4.3 - Li Chao Tree, 4.4 - Convex Hull Trick

5. Trees :

5.1 - BlockCut Tree, 5.2 - Bridge Tree, 5.3 - Dominator Tree, 5.4 - Bridges Online, 5.5 - HLD, 5.6 - LCA, 5.7 - Centroid Decomposition

6. Maths :

6.1 - Chinese Remainder Theorem, 6.2 - Discrete Log, 6.3 - NTT, 6.4 - Online FFT, 6.5 - Lagrange Interpolation, 6.6 - Matrix Struct, 6.7 - nCr(Non Prime Modulo), 6.8 - Primitive Root Generator, 6.9 - Math Miscellaneous, 6.10 - Group Theory, 6.11 - Gaussian Elimination, 6.12 - Inclusion-Exclusion

7. Strings

7.1 - Hashing Theory, 7.2 - Manacher, 7.3 - Trie, 7.4 - Z-algorithm, 7.5 - Aho Corasick, 7.6 - KMP, 7.7 - Palindrome Tree, 7.8 - Suffix Array, 7.9 - Suffix Tree, 7.10 - Suffix Automaton

Ideas

Analysis Complexity Carefully, Relate To Theory, First Find Solution for small sub-problems, Div and Conq, Brute force and observe, (+1,-1), Dominator Tree for Directed Graph, use fenwick, Monte Carlo, Summation Interchange, Clever Optimization of brute force(binary search/ignore), Try solving problem backwards

Tree Ideas

a. LCA b. DSU on trees (possibly make greater depth as heavy child) c. Centroid Decomposition d. HLD e. Euler Tour (dfs order/bfs order/any other ordering) f. Pass some structure(set/array/..) in dfs (segment/fenwick) g. Reachability Tree (construction using dsu) h. Dominator Tree (directed graphs) i. Biconnectivity j. DFS tree

1 Syntax

1.1 Template

```
#include<bits/stdc++.h>
```

```
#include<ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
using namespace std;
#define ll long long

ll mxm() {return LLONG_MIN;}
template<typename... Args>
ll mxm(ll a, Args... args) { return max(a,mxm(args...)); }

ll mnm() {return LLONG_MAX;}
template<typename... Args>
ll mnm(ll a, Args... args) { return min(a,mnm(args...)); }

template<class T> ostream& operator<<(ostream& os, vector<T> V){
    os<<"[";for(auto v:V)os<<v<<" ";return os<<"]";
}

template<class L,class R> ostream& operator<<((ostream& os,pair<L,R> P){
    return os<<"("<<P.first<<","<<P.second<<")";
}

#define TRACE
#ifdef TRACE
#define trace(...) __f(#__VA_ARGS__,__VA_ARGS__)
template<typename Arg1>
void __f(const char* name,Arg1&& arg1){
    cout<<name<<" : "<<arg1<<endl;}
template<typename Arg1,typename... Args>
void __f(const char* names,Arg1&& arg1,Args&&... args){
    const char* comma=strchr(names+1,',');cout.write<<

}

```

2.5 DP Optimization

/*Split L size array into G intervals, minimizing the cost ($G \leq L$). The cost func. $C[i,j]$ satisfies: $C[a,b]+C[c,d] \leq C[a,d]+C[c,b]$ for $a \leq c \leq b \leq d$. (Q.E) & intuitively you can think that the c.f. increases at a rate which is more than linear at all intervals.

So, if the c.f. satisfies Q.E., the following holds:

$F(g,l)$: min cost of splitting first l into g ivalds.
 $F(g,l)$: $\min(F(g-1,k)+C(k+1,l))$ over all valid k.
 $P(g,l)$: lowest position k s.t. it minimizes $F(g,l)$
 $P(g,0) \leq P(g,1) \leq \dots \leq P(g,l)$; DivConq, $O(G.L.\log(L))$
 $P(0,1) \leq P(1,1) \leq P(2,1) \dots \leq P(G-1,1) \leq P(G,1)$.
 Knuth Opti, complexity $O(L.L)$.
 For div&conq, we calculate $P(g,l)$ for each g 1 by 1.
 In each g, we calculate for mid-l and do recursively using the obtained upper and lower bounds. For knuth, we use $P(g,l-1) \leq P(g,l) \leq P(g+1,l)$, and fill our table in increasing l and decreasing g. In opt. BST type problems, use $bk[i][j-1] \leq bk[i][j] \leq bk[i+1][j]$ */

// Code for Divide and Conquer Opti $O(G.L.\log(L))$:

```

ll C[8111]; ll sums[8111];

6.8 Primitive Root Generator

```

/*To find generator of U(p),we check for all
g in [1,p]. But only for powers of the
form phi(p)/p_j, where p_j is a prime factor of
phi(p). Note that p is not prime here.
Existence , if one of these : 1. p = 1,2,4
2. p = q^k , where q -> odd prime.
3. p = 2.(q^k) , where q-> odd prime
Note that a.g^(phi(p)) = 1 (mod p)
b.there are phi(phi(p)) generators if exists.
Finds "a" generator of U(p), multiplicative group
of integers mod p. Here calc_phi returns the ←
toitent
function for p. O(Ans.log(phi(p)).log(p)) +
time for factorizing phi(p). By some theorem,
Ans = O((log(p))^6). Should be fast generally.*/
int generator (int p) {
    vector<int> fact;
    int phi = calc_phi(p), n = phi;
    for (int i=2; i*i<=n; ++i)
        if (n % i == 0) {
            fact.push_back (i);
            while (n % i == 0)
                n /= i;
        }
    if (n > 1)fact.push_back (n);
    for (int res=2; res<=p; ++res) {
        if(gcd(res,p)!=1)continue;
        bool ok = true;
        for (size_t i=0; i<fact.size() && ok; ++i)
            ok &= powmod (res, phi / fact[i], p) != 1;
        if (ok) return res;
    }
    return -1;
}

```

6.9 Math Miscellaneous

```

int gcd(int a,int b,int &x,int &y) {
    if (a == 0) {x = 0; y = 1;return b;}
    int x1,y1,d = gcd(b%a, a, x1, y1);
    x = y1 - (b / a) * x1;y = x1;return d;}
int g (int n) {return n^(n >> 1);} //nth Gray code
int rev_g (int g) {//index of gray code g
    int n = 0;for (; g; g >>= 1)n ^= g;return n;}

```

6.10 Group Theory

```

x^2 = n mod (p). Existence -  $n^{((p-1)/2)} == 1 \rightarrow$   $\leftarrow$ 
    there is a soln.,
else == -1, no solution.
Finding sqrt. in some  $\mathbb{Z} \bmod p$  :
Cipollas Algorithm.
Find an 'a' (randomly) , s.t.  $a^2 - n$  doesn't have a  $\leftarrow$ 
    sqrt.
Adjoin it to the field. Take  $(a + \sqrt{a^2 - n})^{((p-1)/2)}$ .
Do all operations mod p, ans will be integer.
Cipollas Algo works only when mod is prime.
[Remember  $(a+b)^p = a^p + b^p \pmod{p} = a + b \pmod{p}$ ]
For non-prime :
 $x^2 = n \pmod{m}$ .
Soln.  $\rightarrow$  Compute it modulo prime powers and take  $\leftarrow$ 
    CRT.
For prime powers :
We have a solution  $x_0 \bmod p$ . We use it to find a  $\leftarrow$ 
    solution  $\bmod p^2$ ,
then  $p^3$  and so on. For  $p^2$  :  $x^2 = n \pmod{p^2}$ ;  $\leftarrow$ 
    We want x to
    reduce to  $x_0 \bmod p$ . So  $x = x_0 + p \cdot x_1$ . Square it.  $x_0^2 + 2 \cdot x_0 \cdot x_1 \cdot p = n \pmod{p^2}$ .
    Calculate  $x_1$ . This can be extended to find for  $\leftarrow$ 
    greater powers of p.
    But the inverse may not exist always which may  $\leftarrow$ 
    give a problem.
    But then no solution or all solutions. This is  $\leftarrow$ 
    called Hensel's Lifting.
    This can also be extended to find  $f(x) = 0 \bmod p^2$ , if we have a  $\leftarrow$ 
    soln. for  $f(x) = 0 \pmod{p}$ . Get something in  $f'(x) \leftarrow$ 
    .

```

6.11 Gaussian Elimination

```

/*O(n^3)

}

```

Möbius Function

$$\mu(n) = \begin{cases} 0 & n \text{ not squarefree} \\ 1 & n \text{ squarefree w/ even no. of prime factors} \\ -1 & n \text{ squarefree w/ odd no. of prime factors} \end{cases}$$

Note that $\mu(a)\mu(b) = \mu(ab)$ for a, b relatively prime

$$\text{Also } \sum_{d|n} \mu(d) = \begin{cases} 1 & \text{if } n = 1 \\ 0 & \text{otherwise} \end{cases}$$

Möbius Inversion If $g(n) = \sum_{d|n} f(d)$ for all $n \geq 1$, then $f(n) = \sum_{d|n} \mu(d)g(n/d)$ for all $n \geq 1$.

Burnside's Lemma (Text)

The number of orbits of a set X under the group action G equals the average number of elements of X fixed by the elements of G .

Here's an example. Consider a square of $2n$ times $2n$ cells. How many ways are there to color it into X colors, up to rotations and/or reflections? Here, the group has only 8 elements (rotations by 0, 90, 180 and 270 degrees, reflections over two diagonals, over a vertical line and over a horizontal line). Every coloring stays itself after rotating by 0 degrees, so that rotation has X^{4n^2} fixed points. Rotation by 180 degrees and reflections over a horizontal/vertical line split all cells in pairs that must be of the same color for a coloring to be unaffected by such rotation/reflection, thus there exist X^{2n^2} such colorings for each of them. Rotations by 90 and 270 degrees split cells in groups of four, thus yielding X^{n^2} fixed colorings. Reflections over diagonals split cells into $2n$ groups of 1 (the diagonal itself) and $2n^2 - n$ groups of 2 (all remaining cells), thus yielding $X^{2n^2-n+2n} = X^{2n^2+n}$ unaffected colorings. So, the answer is $(X^{4n^2} + 3X^{2n^2} + 2X^{n^2} + 2X^{2n^2+n})/8$. Every tree with n vertices has $n - 1$ edges.

Trees-Kraft inequality:

If the depths of the leaves of a binary tree are $d_1 \dots d_n$: $\sum_{i=1}^n 2^{-d_i} \leq 1$, and equality holds only if every internal node has 2 sons.

Euler Tour:

- Undirected graph iff All vertices have even degree, all non-zero degree vertices are in a single connected component.(Can be decomposed into edge-disjoint cycles)
- Directed graph iff For each vertex in-degree=out-degree, all non-zero degree vertices are in a single strongly connected component.(Decomposable into directed-edge disjoint cycles)

Euler Trail:

- Undirected graph iff exactly 0 or 2 vertices have odd degree, single connected component(consider zero degree vertices only).
- Directed graph iff at most one vertex has (out-degree)-(in-degree) = 1, at most one vertex has (in-degree)-(out-degree) = 1, every other vertex has equal in-degree and out-degree, and all of its vertices with nonzero degree belong to a single connected component of the underlying undirected graph.

Master method:

$$T(n) = aT(n/b) + f(n), \quad a \geq 1, b > 1$$

If $\exists \epsilon > 0$ such that $f(n) = O(n^{\log_b a - \epsilon})$ then $T(n) = \Theta(n^{\log_b a})$.

If $f(n) = \Theta(n^{\log_b a})$ then $T(n) = \Theta(n^{\log_b a} \log_2 n)$.

If $\exists \epsilon > 0$ such that $f(n) = \Omega(n^{\log_b a + \epsilon})$, and $\exists c < 1$ such that $af(n/b) \leq cf(n)$ for large n , then $T(n) = \Theta(f(n))$.

Probability:

Variance, standard deviation: $\text{Var}[X] = E[X^2] - E[X]^2$

Poisson distribution:

Normal (Gaussian) distribution:

$$\Pr[X = k] = \frac{e^{-\lambda} \lambda^k}{k!}, \quad E[X] = \lambda \quad \left| \quad p(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-(x-\mu)^2/2\sigma^2}, \quad E[X] = \mu.$$

The "coupon collector": We are given a random coupon each day, and there are n different types of coupons. The distribution of coupons is uniform. The expected number of days to pass before we to collect all n types is nH_n .

Miscellaneous:

1. Radius of inscribed circle for Right Angle Triangle: $\frac{AB}{A+B+C}$
2. Law of cosine: $c^2 = a^2 + b^2 - 2ab \cos C$
3. Area of a triangle: Area: $A = \frac{1}{2}hc = \frac{1}{2}ab \sin C = \frac{c^2 \sin A \sin B}{2 \sin C}$.
4. $\det A = \sum_{\pi} \prod_{i=1}^n \text{sign}(\pi) a_{i, \pi(i)}$, for Permanents remove sign.
5. Perfect Numbers: x is an even perfect number iff $x = 2^{n-1}(2^n - 1)$ and $2^n - 1$ is prime.
6. Wilson's theorem: n is a prime iff $(n-1)! \equiv -1 \pmod n$.
7. If graph G is planar then $n - m + f = 2$, so $f \leq 2n - 4$, $m \leq 3n - 6$. Any planar graph has a vertex with degree ≤ 5 .
8. Dirichlet power series: $A(x) = \sum_{i=1}^{\infty} \frac{a_i}{i^x}$
9. Coefficient of x^r in $(1-x)^{-n}$ is $\binom{n+r-1}{r}$.
10. Stirling numbers (1st kind):
 $s(n, 2) = (n-1)!H_{n-1}$, $s(n, k) = (n-1)s(n-1, k) + s(n-1, k-1)$

11. Stirling numbers (2nd kind): $S(n, k) = kS(n-1, k) + S(n-1, k-1)$
 $S(n, k) = \frac{1}{k!} \sum_{j=0}^k (-1)^{k-j} \binom{k}{j} j^n$, $S(n, m) = \sum_k \binom{n}{k} S(k+1, m+1) (-1)^{n-k}$
12. Catalan Numbers: Binary trees with $n+1$ vertices $C_n = \frac{1}{n+1} \binom{2n}{n}$

Primes

$\forall (a, b)$, The largest prime smaller than 10^a is $p = 10^a - b$

(1, 3), (2, 3), (3, 3), (4, 27), (5, 9), (6, 17), (7, 9), (8, 11), (9, 63), (10, 33),
 (11, 23), (12, 11), (13, 29), (14, 27), (15, 11), (16, 63), (17, 3), (18, 11)

For Bipartite Graphs

1. Min-edge cover(me) = Max-independent set(mi) (G has no isolated vertex).
2. Min-vertex cover(mv) = Max matching(mm) $mi + mv = |V|$, $mi \geq \frac{|V|}{2}$
3. Min-edge cover subgraph is a combination of star graphs.
4. Min Vertex cover : In residual graph of max flow pick all the vertices in L(left bipartite) not reachable from s(whose edges are cut) and lly in R reachable from s.
5. Min-edge cover(no isolated vertex) : Find max matching, take all those edges, for vertices not covered take any edge.

$$(1) \sum_{i=1}^n i^m = \frac{1}{m+1} \left[(n+1)^{m+1} - 1 - \sum_{i=1}^n ((i+1)^{m+1} - i^{m+1} - (m+1)i^m) \right]$$

$$(2) \frac{x}{(1-x)^2} = \sum_{i=0}^{\infty} ix^i, \quad (3) \ln(1+x) = \sum_{i=1}^{\infty} (-1)^{i+1} \frac{x^i}{i}, \quad (4) \frac{x}{1-x-x^2} = \sum_{i=0}^{\infty} F_i x^i$$

$$(5) (x_1 + x_2 + \dots + x_k)^n = \sum_{c_1+c_2+\dots+c_k=n} \frac{n!}{c_1! \dots c_k!} x_1^{c_1} x_2^{c_2} \dots x_k^{c_k}, \quad (6) \frac{1}{(1-x)^{n+1}} = \sum_{i=0}^{\infty} \binom{i+n}{i} x^i$$

$$(1) \int \tanh x dx = \ln |\cosh x|, \quad (2) \int \coth x dx = \ln |\sinh x|, \quad (3) \int \frac{dx}{a^2 - x^2} = \frac{1}{2a} \ln \left| \frac{a+x}{a-x} \right|,$$

$$(4) \int \frac{dx}{\sqrt{a^2 + x^2}} = \ln \left(x + \sqrt{a^2 + x^2} \right) \quad (a > 0), \quad (5) \int \frac{dx}{a^2 + x^2} = \frac{1}{a} \arctan \frac{x}{a} \quad (a > 0),$$

$$(6) \int \sqrt{a^2 - x^2} dx = \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \arcsin \frac{x}{a} \quad (a > 0) \quad (7) \int \frac{dx}{\sqrt{a^2 - x^2}} = \arcsin \frac{x}{a} \quad (a > 0)$$

Fibonacci:

1. $F_{-i} = (-1)^{i-1} F_i$, $F_i = \frac{1}{\sqrt{5}} (\phi^i - \hat{\phi}^i)$
2. Cassini's identity: $F_{i+1} F_{i-1} - F_i^2 = (-1)^i$ for $i > 0$,
3. Additive Rule: $F_{n+k} = F_k F_{n+1} + F_{k-1} F_n$, $F_{2n} = F_n F_{n+1} + F_{n-1} F_n$
4. Every integer n has a unique representation $n = F_{k_1} + F_{k_2} + \dots + F_{k_m}$, where $k_i \geq k_{i+1} + 2$ for $1 \leq i < m$ and $k_m \geq 2$.
